

Agreement between independently extracted views

Where the extra names go

16 cases x 3 extractor models (DeepSeek-V3.1, gpt-oss-120b, MiniMax-M2.7), 192/192 extractions scored, no case lost to fallback. Documents, prompt, chunking and seed held fixed; only the ontology moves. The registered prediction (CLAUDE.md, 2026-05-31) is that a middle-sized ontology beats both no ontology and an over-large one; B at 20 classes is the middle and C/D at 70 are the over-large end. Differences against A are separated from zero by a case-resampled interval; B, C and D are not separated from each other.
